Abstract of JP 2001083155 (A)

PROBLEM TO BE SOLVED: To measure a triazine herbicide by using an immobilized photosynthetic reaction central protein with a histidine tag at a chip substrate. **SOLUTION:** In a measuring chip, a photosynthetic reaction central protein with a histidine tag is immobilized to a chip substrate. The measuring chip is mounted on a surface plasmon resonance measuring device (SPR) and can be used to measure a triazine herbicide. First, the chip is mounted on the SPR measuring device. That is, the chip 13 is installed so that a transparent substrate is disposed above. Then, a sample liquid containing an admixture substance 15 and a substance 16 to be measured is fed through a channel 17. Then, a monochromatic light is irradiated from a light source 9 toward a transparent substrate of the chip 13 (incident light 11), and a reflected light 12 of a metal film provided at the chip 13 is incident to a detector 10. The detector 10 can detect an intensity of the reflected light 12.
